

ENVIRONMENTAL TESTING LAB OPENS IN RED DEER

APRIL 01, 2010 – RED DEER, ALBERTA Central Alberta Producers have a new, local choice to consider for their laboratory analysis requirements. Central Labs Ltd. is an environmental testing facility located in Red Deer, Alberta, servicing residential, agricultural and oilfield testing requirements.

Not a depot, it provides on-site local analysis on soil, water and oilfield samples. Mitch Golay, business development manager, saw a need for something local. “Many of our clients are finding the testing time has been dramatically reduced without the re-direction of the samples. One client was so relieved of a local lab startup, as he was frustrated with the cost & time of re-submitting samples that had been broken in time-consuming transport.”

The laboratory, currently located at #10, 6874-52 Ave. offers a variety of analysis. Particular to local interest is soil nutrient analysis and water quality. “Successful producers treat their operations like a business; excessive fertilizer application is throwing away money, and under-fertilization is missing the opportunity to maximize your productivity”, says Golay.

Additionally, Golay says he is overwhelmed by the local spirit of support. Between the Red Deer Chambers’ “Local:First” initiative and the amazing support of local individuals and business, he does not think twice about moving his family, business and personal interests to Central Alberta. “I just wish I did it years earlier”, he says.

For more information, you can contact Central Labs at (403) 348-8378. Alternatively, you can find out most of what they do and sampling techniques on their website at <http://www.c-labs.ca>
